I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

1 FEATURES

- 5 V supply voltage
- Gain controlled wide-band Vision Intermediate Frequency (VIF) amplifier, AC-coupled
- Multistandard true synchronous demodulation with active carrier regeneration: very linear demodulation, good intermodulation figures, reduced harmonics, and excellent pulse response
- Gated phase detector for L and L-accent standard
- Fully integrated VIF Voltage Controlled Oscillator (VCO), alignment-free, frequencies switchable for all negative and positive modulated standards via I²C-bus
- Digital acquisition help, VIF frequencies of 33.4, 33.9, 38.0, 38.9, 45.75, and 58.75 MHz
- 4 MHz reference frequency input: signal from Phase-Locked Loop (PLL) tuning system or operating as crystal oscillator
- VIF Automatic Gain Control (AGC) detector for gain control, operating as peak sync detector for negative modulated signals and as a peak white detector for positive modulated signals
- VIF-AGC monitor output at pin OP2
- External VIF-AGC setting via pin OP1
- Precise fully digital Automatic Frequency Control (AFC) detector with 4-bit digital-to-analog converter, AFC bits readable via I²C-bus
- TakeOver Point (TOP) adjustable via I²C-bus or alternatively with potentiometer
- Fully integrated sound carrier trap for 4.5, 5.5, 6.0, and 6.5 MHz, controlled by FM-PLL oscillator
- Sound IF (SIF) input for single reference Quasi Split Sound (QSS) mode, PLL controlled
- SIF-AGC for gain controlled SIF amplifier, single reference QSS mixer able to operate in high performance single reference QSS mode and in intercarrier mode, switchable via I²C-bus
- AM demodulator without extra reference circuit
- Alignment-free selective FM-PLL demodulator with high linearity and low noise
- I²C-bus control for all functions
- I²C-bus transceiver with pin programmable Module Address (MAD)
- Four selectable I²C-bus addresses
- SIF and FM-AGC for radio (optional)
- Radio IF (RIF) input using the sound IF SAW input for converting to 10.7 MHz, input frequencies are 41.3 MHz for NTSC (M/N standard) applications and 33.3 MHz for other applications
- Alignment-free FM radio demodulation at 10.7 MHz
- Radio AFC
- External FM input and demodulation.

2 GENERAL DESCRIPTION

The TDA9887 is an alignment-free multistandard (PAL, SECAM and NTSC) vision and sound IF signal PLL demodulator for positive and negative modulation, including sound AM and FM processing. A special function is implemented for the demodulation of FM radio signals ($f_{RIF} = 10.7$ MHz).

3 APPLICATIONS

- TV, VTR, PC, and STB applications.

4 ORDERING INFORMATION

| TYPE NUMBER | PACKAGE | | |

Notes

1. Values of video and sound parameters can be decreased at $V_P = 4.5$ V.
2. For applications without I²C-bus, the time constant ($R \times C$) at the supply must be $>1.2 \mu$ s (e.g. 1 Ω and 2.2 μ F).
3. Condition: luminance range (5 steps) from 0 % to 100 %.
4. AC load: $C_L < 20$ pF and $R_L > 1$ k Ω . The sound carrier frequencies (depending on the TV standard) are attenuated by the integrated sound carrier traps (see Figs 15 to 20; $|H(s)|$ is the absolute value of transfer function).
5. S/N_W is the ratio of the black-to-white amplitude to the black level noise voltage (RMS value measured on pin CVBS). B = 5 MHz weighted in accordance with "CCIR 567".

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

6. The intercarrier output signal at pin SIOMAD can be calculated by the following formula taking into account the internal video signal with 1.1 V (p-p) as a reference:

$$V_{o(\text{intc})(\text{rms})} = 1.1 \times \frac{1}{2\sqrt{2}} \times 10^r \text{ V}$$

$$\text{and } r = \frac{1}{20} \times \left(\frac{V_{i(\text{SC})}}{V_{i(\text{PC})}} (\text{dB}) + 6 \text{ dB} \pm 3 \text{ dB} \right)$$

where:

$\frac{1}{2\sqrt{2}}$ is the correction term for RMS value, $\frac{V_{i(\text{SC})}}{V_{i(\text{PC})}} (\text{dB})$ is the sound-to-picture carrier ratio at pins VIF1 and VIF2 in dB, 6 dB is the correction term of internal circuitry and $\pm 3 \text{ dB}$ is the tolerance of video output and intercarrier output $V_{o(\text{intc})(\text{rms})}$.

7. Pin REF is able to operate as a 1-pin crystal oscillator input as well as an external reference signal input, e.g. from the tuning system.

I²C-bus controlled multistandard alignment-free
IF-PLL demodulator with FM radio

TDA9887

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

8 FUNCTIONAL DESCRIPTION

Figure 1 shows the simplified block diagram of the device which comprises the following functional blocks:

- VIF amplifier
- Tuner AGC and VIF-AGC
- VIF-AGC detector
- Frequency Phase-Locked Loop (FPLL) detector
- VCO and divider
- AFC and digital acquisition help
- Video demodulator and amplifier
- Sound carrier trap
- SIF amplifier
- SIF-AGC detector
- Single reference QSS mixer
- AM demodulator
- FM demodulator and acquisition help
- Audio amplifier and mute time constant
- Radio mode
- Internal voltage stabilizer
- I²C-bus transceiver and MAD (module address).

8.1 VIF amplifier

The VIF amplifier consists of three AC-coupled differential stages. Gain control is performed by emitter degeneration. The total gain control range is typically 66 dB. The differential input impedance is typically 2 k Ω in parallel with 3 pF.

8.2 Tuner AGC and VIF-AGC

This block adapts the voltages, generated at the VIF-AGC and SIF-AGC detectors, to the internal signal processing at the VIF and SIF amplifiers and performs the tuner AGC control current generation. The onset of the tuner AGC control current generation can be set either via the I²C-bus (see Table 13) or optionally by a potentiometer at pin TOP (in case that the I²C-bus information cannot be stored). The presence of a potentiometer is automatically detected and the I²C-bus setting is disabled.

Furthermore, derived from the AGC detector voltage, a comparator is used to test if the corresponding VIF input voltage is higher than 200 μ V. This information can be read out via the I²C-bus (bit VIFLEV = 1).

8.3 VIF-AGC detector

Gain control is performed by sync level detection (negative modulation) or peak white detection (positive modulation).

For negative modulation, the sync level voltage is stored at an integrated capacitor by means of a fast peak detector. This voltage is compared with a reference voltage (nominal sync level) by a comparator which charges or discharges the integrated AGC capacitor for the generation of the required VIF gain. The time constants for decreasing or increasing the gain are nearly equal and the total AGC reaction time is fast to cope with 'aeroplane fluttering'.

For positive modulation, the white peak level voltage is compared with a reference voltage (nominal white level) by a comparator which charges (fast) or discharges (slow) the external AGC capacitor directly for the generation of the required VIF gain. The need of a very long time constant for VIF gain increase is because the peak white level may appear only once in a field. In order to reduce this time constant, an additional level detector increases the discharging current of the AGC capacitor (fast mode) in the event of a decreasing VIF amplitude step controlled by the detected actual black level voltage. The threshold level for fast mode AGC is typically -6 dB video amplitude. The fast mode state is also transferred to the SIF-AGC detector for speed-up. In case of missing peak white pulses, the VIF gain increase is limited to typically +3 dB by comparing the detected actual black level voltage with a corresponding reference voltage.

8.4 FPLL detector

The VIF amplifier output signal is fed into a frequency detector and into a phase detector via a limiting amplifier for removing the video AM.

During acquisition the frequency detector produces a current proportional to the frequency difference between the VIF and the VCO signals. After frequency lock-in the phase detector produces a current proportional to the phase difference between the VIF and the VCO signals. The currents from the frequency and phase detectors are charged into the loop filter which controls the VIF VCO and locks it to the frequency and phase of the VIF carrier.

For a positive modulated VIF signal, the charging currents are gated by the composite sync in order to avoid signal distortion in case of overmodulation. The gating depth is switchable via the I²C-bus.

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

8.5 VCO and divider

The VCO of the VIF-FPLL operates as an integrated low radiation relaxation oscillator at double the picture carrier frequency. The control voltage, required to tune the VCO to double the picture carrier frequency, is generated at the loop filter by the frequency phase detector. The possible frequency range is 50 to 140 MHz (typical value).

The oscillator frequency is divided-by-two to provide two differential square wave signals with exactly 90 degrees phase difference, independent of the frequency, for use in the FPLL detectors, the video demodulator and the intercarrier mixer.

8.6 AFC and digital acquisition help

Each relaxation oscillator of the VIF-PLL and FM-PLL demodulator has a wide frequency range. To prevent false locking of the PLLs and with respect to the catching range, the digital acquisition help provides an individual control, until the frequency of the VCO is within the preselected standard dependent lock-in window of the PLL.

The in-window and out-window control at the FM-PLL is additionally used to mute the audio stage (if auto mute is selected via the I²C-bus).

The working principle of the digital acquisition help is as follows. The PLL VCO output is connected to a down counter which has a predefined start value (standard dependent). The VCO frequency clocks the down counter for a fixed gate time. Thereafter, the down counter stop value is analysed. In case the stop value is higher (lower) than the expected value range, the VCO frequency is lower (higher) than the wanted lock-in window frequency range. A positive (negative) control current is injected into the PLL loop filter and consequently the VCO frequency is increased (decreased) and a new counting cycle starts.

The gate time as well as the control logic of the acquisition help circuit is dependent on the precision of the reference signal at pin REF. Operation as a crystal oscillator is possible as well as connecting this input via a serial capacitor to an external reference frequency, e.g. the tuning system oscillator.

The AFC signal is derived from the corresponding down counter stop value after a counting cycle. The last four bits are latched and can be read out via the I²C-bus (see Table 7). Also the digital-to-analog converted value is given as current at pin AFC.

8.7 Video demodulator and amplifier

The video demodulator is realized by a multiplier which is designed for low distortion and large bandwidth. The VIF signal is multiplied with the 'in phase' signal of the VIF-PLL VCO.

The demodulator output signal is fed into the video preamplifier via a level shift stage with integrated low-pass filter to achieve carrier harmonics attenuation.

The output signal of the preamplifier is fed to the VIF-AGC detector (see Section 8.3) and in the sound trap mode also fed internally to the integrated sound carrier trap (see Section 8.8). The differential trap output signal is converted and amplified by the following postamplifier. The video output level at pin CVBS is 2 V (p-p).

In the bypass mode the output signal of the preamplifier is fed directly through the postamplifier to pin CVBS. The output video level is 1.1 V (p-p) for using an external sound trap with 10 % overall loss.

Noise clipping is provided in both cases.

8.8 Sound carrier trap

The sound carrier trap consists of a reference filter, a phase detector and the sound trap itself.

A sound carrier reference signal is fed into the reference low-pass filter and is shifted by nominal 90 degrees. The phase detector compares the original reference signal with the signal shifted by the reference filter and produces a DC voltage by charging or discharging an integrated capacitor with a current proportional to the phase difference between both signals, respectively to the frequency error of the integrated filters. The DC voltage controls the frequency position of the reference filter and the sound trap. So the accurate frequency position for the different standards is set by the sound carrier reference signal.

The sound trap itself is constructed of three separate traps to realize sufficient suppression of the first and second sound carriers.

8.9 SIF amplifier

The SIF amplifier consists of three AC-coupled differential stages. Gain control is performed by emitter degeneration. The total gain control range is typically 66 dB. The differential input impedance is typically 2 k Ω in parallel with 3 pF.

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

8.10 SIF-AGC detector

SIF gain control is performed by the detection of the DC component of the AM demodulator output signal. This DC signal corresponds directly to the SIF voltage at the output of the SIF amplifier so that a constant SIF signal is supplied to the AM demodulator and to the single reference QSS mixer.

By switching the gain of the input amplifier of the SIF-AGC detector via the I²C-bus, the internal SIF level for FM sound is 5.5 dB lower than for AM sound. This is to adapt the SIF-AGC characteristic to the VIF-AGC characteristic. The adaption is ideal for a picture-to-sound FM carrier ratio of 13 dB.

Via a comparator, the integrated AGC capacitor is charged or discharged for the generation of the required SIF gain. Due to AM sound, the AGC reaction time is slow ($f_c < 20$ Hz for the closed AGC loop). For reducing this AM sound time constant in the event of a decreasing IF amplitude step, the load current of the AGC capacitor is increased (fast mode) when the VIF-AGC detector (at positive modulation mode) operates in the fast mode too. An additional circuit (threshold approximately 7 dB) ensures a very fast gain reduction for a large increasing IF amplitude step.

8.11 Single reference QSS mixer

With the present system a high performance Hi-Fi stereo sound processing can be achieved. For a simplified application without a SIF SAW filter, the single reference QSS mixer can be switched to the intercarrier mode via the I²C-bus.

The single reference QSS mixer generates the 2nd FM TV sound intercarrier signal. It is realized by a linear multiplier which multiplies the SIF amplifier output signal and the VIF-PLL VCO signal (90 degrees output) which is locked to the picture carrier. In this way the QSS mixer operates as a quadrature mixer in the intercarrier mode and provides suppression of the low frequency video signals.

The QSS mixer output signal is fed internally via a high-pass and low-pass combination to the FM demodulator as well as via an operational amplifier to the intercarrier output pin SIOMAD.

8.12 AM demodulator

The amplitude modulated SIF amplifier output signal is fed both to a two-stage limiting amplifier that removes the AM and to a linear multiplier. The result of the multiplication of the SIF signal with the limiter output signal is AM demodulation (passive synchronous demodulator). The demodulator output signal is fed via a low-pass filter that attenuates the carrier harmonics and via the input amplifier of the SIF-AGC detector to the audio amplifier.

8.13 FM demodulator and acquisition help

The narrow-band FM-PLL detector consists of:

- Gain controlled FM amplifier and AGC detector
- Narrow-band PLL.

The intercarrier signal from the intercarrier mixer or from pin FMIN is fed to the input of an AC-coupled gain controlled amplifier with two stages. The gain controlled output signal is fed to the phase detector of the narrow-band FM-PLL (FM demodulator). For good selectivity and robustness against disturbance caused by the video signal, a high linearity of the gain controlled FM amplifier and of the phase detector as well as a constant signal level are required. The gain control is done by means of an 'in phase' demodulator for the FM carrier (from the output of the FM amplifier). The demodulation output is fed into a comparator for charging or discharging the integrated AGC capacitor. This leads to a mean value AGC loop to control the gain of the FM amplifier.

The FM demodulator is realized as a narrow-band PLL with an external loop filter, which provides the necessary selectivity (bandwidth approximately 100 kHz). To achieve good selectivity, a linear phase detector and a constant input level are required. The gain controlled intercarrier signal from the FM amplifier is fed to the phase detector. The phase detector controls via the loop filter the integrated low radiation relaxation oscillator. The designed frequency range is from 4 to 7 MHz.

The VCO within the FM-PLL is phase-locked to the incoming 2nd SIF signal, which is frequency modulated. As well as this, the VCO control voltage is superimposed by the AF voltage. Therefore, the VCO tracks with the FM of the 2nd SIF signal. So, the AF voltage is present at the loop filter and is typically 5 mV (RMS) for 27 kHz FM deviation. This AF signal is fed via a buffer to the audio amplifier.

The correct locking of the PLL is supported by the digital acquisition help circuit (see Section 8.6).

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

8.14 Audio amplifier and mute time constant

The audio amplifier consists of two parts:

- AF preamplifier
- AF output amplifier.

The AF preamplifier used for FM sound is an operational amplifier with internal feedback, high gain and high common mode rejection. The AF voltage from the PLL demodulator is 5 mV (RMS) for a frequency deviation of 27 kHz and is amplified by 30 dB. By the use of a DC operating point control circuit (with external capacitor C_{AF}), the AF preamplifier is decoupled from the PLL DC voltage. The low-pass characteristic of the amplifier reduces the harmonics of the sound intercarrier signal at the AF output terminal.

For FM sound a switchable de-emphasis network (with external capacitor) is implemented between the preamplifier and the output amplifier.

The AF output amplifier provides the required AF output level by a rail-to-rail output stage. A preceding stage makes use of an input selector for switching between FM sound, AM sound and mute state. The gain can be switched between 10 dB (normal) and 4 dB (reduced).

Switching to the mute state is controlled automatically, dependent on the digital acquisition help in case the VCO of the FM-PLL is not in the required frequency window. This is done by a time constant: fast for switching to the mute state and slow (typically 40 ms) for switching to the no-mute state.

All switching functions are controlled via the I²C-bus:

- AM sound, FM sound and forced mute
- Auto mute enable or disable
- De-emphasis off or on with 50 or 75 μ s
- Audio gain normal or reduced.

8.15 Radio mode

The principle is to multiply the first radio IF (e.g. 33.3 MHz at tuner output) with 44 MHz reference signal. The result of the down-conversion is the second radio IF (10.7 MHz) at intercarrier output.

In the radio mode the tuner delivers a first radio IF signal of 33.3 MHz. This signal is fed via the SIF SAW filter (conventional used for QSS TV sound processing) to the SIF input. The sound IF amplifier supplies this radio IF signal by means of gain control with constant level to the QSS mixer. The single reference QSS mixer generates the second radio IF signal of 10.7 MHz. In the radio mode the VIF VCO operates as part of a frequency synthesizer and

delivers a constant 44 MHz signal (derived from the reference signal of 4 MHz) for the down-conversion of the first radio IF to 10.7 MHz. This signal is fed via the external ceramic band-pass filter to the FM demodulator. The demodulated AF signal is amplified by the audio amplifier.

In case of NTSC application (M/N standard) the internal mixing frequency is 52 MHz. So, the first radio IF has to be 41.3 MHz.

In the radio mode, the tuner AGC is derived from the SIF-AGC.

For tuning search mode, the device offers certain monitoring functions. Switchable are radio AFC, FM-AGC or SIF-AGC to pin AFC.

8.16 Internal voltage stabilizer

The band gap circuit internally generates a voltage of approximately 2.4 V, independent of supply voltage and temperature. A voltage regulator circuit, connected to this voltage, produces a constant voltage of 3.55 V which is used as an internal reference voltage.

8.17 I²C-bus transceiver and module address

The device can be controlled via the 2-wire I²C-bus by a microcontroller. Two wires carry serial data (SDA) and serial clock (SCL) information between the devices connected to the I²C-bus.

The device has an I²C-bus slave transceiver with auto-increment. The circuit operates up to clock frequencies of 400 kHz.

A slave address is sent from the master to the slave receiver. To avoid conflicts in a real application with other devices providing similar or complementing functions, there are four possible slave addresses available. These Module Addresses (MADs) can be selected by connecting resistors on pin SIOMAD and/or pins SIF1 and SIF2 (see Fig.25). Pin SIOMAD relates with bit A0 and pins SIF1 and SIF2 relate with bit A3. The slave addresses of this device are given in Table 1.

The power-on preset value is dependent on the use of pin SIOMAD and can be chosen for 45.75 MHz NTSC as default (pin SIOMAD left open-circuit) or 58.75 MHz NTSC (resistor on pin SIOMAD). In this way the device can be used without the I²C-bus as an NTSC only device.

Remark: In case of using the device without the I²C-bus, then the rise time of the supply voltage after switching on power must be longer than 1.2 μ s.

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

Table 1 Slave address detection

| SLAVE ADDRESS | SELECTABLE ADDRESS BIT | | RESISTOR ON PIN | |
|---------------|------------------------|----|-----------------|--------|
| | A3 | A0 | SIF1 AND SIF2 | SIOMAD |
| MAD1 | 0 | 1 | no | no |
| MAD2 | 0 | 0 | no | yes |
| MAD3 | 1 | 1 | yes | no |
| MAD4 | 1 | 0 | yes | yes |

9 I²C-BUS CONTROL

9.1 Read format

Table 2 I²C-bus read format (slave transmits data)

| S | BYTE 1 | | | | | | | | A | BYTE 2 | | | | | | | | AN | P |
|---|---------------|----|----|----|----|----|----|--------------|---|--------|----|----|----|----|----|----|----|----|---|
| | A6 | A5 | A4 | A3 | A2 | A1 | A0 | R/ \bar{W} | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | | |
| | slave address | | | | | | | 1 | | data | | | | | | | | | |

Table 3 Explanation of Table 2

| SYMBOL | FUNCTION |
|------------------|---|
| S | START condition, generated by the master |
| Slave address | see Table 4 |
| R/ \bar{W} = 1 | read command, generated by the master |
| A | acknowledge bit, generated by the slave |
| Data | 8-bit data word, transmitted by the slave (see Table 5) |
| AN | acknowledge-not bit, generated by the master |
| P | STOP condition, generated by the master |

The master generates an acknowledge when it has received the dataword READ. The master next generates an acknowledge, then slave begins transmitting the dataword READ, and so on until the master generates an acknowledge-not bit and transmits a STOP condition.

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

9.1.1 SLAVE ADDRESS

The first module address MAD1 is the standard address (see Table 1).

Table 4 Slave addresses; notes 1 and 2

| SLAVE ADDRESS | | BIT | | | | | | |
|---------------|-------------|-----|----|----|----|----|----|----|
| NAME | VALUE (HEX) | A6 | A5 | A4 | A3 | A2 | A1 | A0 |
| MAD1 | 43 | 1 | 0 | 0 | 0 | 0 | 1 | 1 |
| MAD2 | 42 | 1 | 0 | 0 | 0 | 0 | 1 | 0 |
| MAD3 | 4B | 1 | 0 | 0 | 1 | 0 | 1 | 1 |
| MAD4 | 4A | 1 | 0 | 0 | 1 | 0 | 1 | 0 |

Notes

1. For MAD activation via external resistor: see Table 1 and Fig.25.
2. For applications without I²C-bus: see Tables 18 and 19.

9.1.2 DATA BYTE

Table 5 Data read register (status register)

| MSB | | | | | | | LSB |
|--------|--------|---------|------|------|------|------|------|
| D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
| AFCWIN | VIFLEV | CARRDET | AFC4 | AFC3 | AFC2 | AFC1 | PONR |

Table 6 Description of status register bits

| BIT | VALUE | DESCRIPTION |
|----------|-------|--|
| AFCWIN | 1 | AFC window VCO in ± 1.6 MHz AFC window; note 1 |
| | 0 | VCO out of ± 1.6 MHz AFC window |
| VIFLEV | 1 | VIF input level high level; VIF input voltage ≥ 200 μ V (typically) |
| | 0 | low level |
| CARRDET | 1 | FM carrier detection detection |
| | 0 | no detection |
| AFC[4:1] | | Automatic frequency control see Table 7 |
| PONR | 1 | Power-on reset after Power-on reset or after supply breakdown |
| | 0 | after a successful reading of the status register |

Note

1. If no IF input is applied, then bit AFCWIN = 1 due to the fact that the VCO is forced to the AFC window border for fast lock-in behaviour.

I²C-bus controlled multistandard alignment-free
IF-PLL demodulator with FM radio

TDA9887

Table 7 Automatic frequency control bits; note 1

| BIT | | | | f _{VIF} |
|------|------|------|------|--------------------------------|
| AFC4 | AFC3 | AFC2 | AFC1 | |
| 0 | 1 | 1 | 1 | ≤ (f ₀ – 187.5 kHz) |

| 0 | 0 | 1 | 0 | f ₀ – 62.5 kHz |
| 0 | 0 | 0 | 1 | f ₀ – 37.5 kHz |
| 0 | 0 | 0 | 0 | f ₀ – 12.5 kHz |
| 1 | 1 | 1 | 1 | f ₀ + 12.5 kHz |
| 1 | 1 | 1 | 0 | f ₀ + 37.5 kHz |
| 1 | 1 | 0 | 1 | f ₀ + 62.5 kHz |
| 1 | 1 | 0 | 0 | f ₀ + 87.5 kHz |
| 1 | 0 | 1 | 1 | f ₀ + 112.5 kHz |
| 1 | 0 | 1 | 0 | f ₀ + 137.5 kHz |
| 1 | 0 | 0 | 1 | f ₀ + 162.5 kHz |
| 1 | 0 | 0 | 0 | ≥ (f ₀ + 187.5 kHz) |

Note

- f₀ is the nominal frequency of f_{VIF}.

9.2 Write format

Table 8 I²C-bus write format (slave receives data); note 1

| S | BYTE 1 | | A | BYTE 2 | | A | BYTE 3 | | A | BYTE n | | A | P |
|---|---------------|-----|---|------------|--|---|-------------|--|---|-------------|--|---|---|
| | A6 to A0 | R/W | | A7 to A0 | | | bits 7 to 0 | | | bits 7 to 0 | | | |
| | slave address | 0 | | subaddress | | | data 1 | | | data n | | | |

Note

- The auto-increment of the subaddress stops if the subaddress is 3.

Table 9 Explanation of Table 8

| SYMBOL | FUNCTION |
|------------------|--|
| S | START condition, generated by the master |
| Slave address | see Table 4 |
| R/W = 0 | write command, generated by the master |
| A | acknowledge bit, generated by the slave |
| Subaddress (SAD) | see Table 10 |
| Data 1, data n | 8-bit data words, transmitted by the master (see Tables 11, 12 and 14) |
| P | STOP condition |

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

9.2.1 SUBADDRESS

If more than one data byte is transmitted, then auto-increment is performed: starting from the transmitted subaddress and auto-increment of subaddress in accordance with the order of Table 10.

Table 10 Definition of the subaddress (second byte after slave address); note 1

| REGISTER | MSB | | | | | | LSB | |
|------------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-----|----|
| | A7 ⁽²⁾ | A6 ⁽³⁾ | A5 ⁽³⁾ | A4 ⁽³⁾ | A3 ⁽³⁾ | A2 ⁽³⁾ | A1 | A0 |
| SAD for switching mode | 0 | X | X | X | X | X | 0 | 0 |
| SAD for adjust mode | 0 | X | X | X | X | X | 0 | 1 |
| SAD for data mode | 0 | X | X | X | X | X | 1 | 0 |

Notes

1. X = don't care.
2. Bit A7 = 1 is not allowed.
3. Bits A6 to A2 will be ignored by the internal hardware.

9.2.2 DATA BYTE FOR SWITCHING MODE

Table 11 Bit description of SAD register for switching mode (SAD = 00)

| BIT | VALUE | DESCRIPTION |
|-----------|-------|---|
| B7 | 1 | Output port 2 e.g. for SAW switching or AGC monitoring high-impedance, disabled or HIGH |
| | 0 | low-impedance, active or LOW |
| B6 | 1 | Output port 1 e.g. for SAW switching or external AGC input high-impedance, disabled or HIGH |
| | 0 | low-impedance, active or LOW |
| B5 | 1 | Forced audio mute on |
| | 0 | off |
| B4 and B3 | 00 | TV standard modulation and radio mode positive AM TV; note 1 |
| | 01 | FM radio; note 2 |
| | 10 | negative FM TV |
| | 11 | FM radio; note 2 |
| B2 | 1 | Carrier mode QSS mode |
| | 0 | intercarrier mode |
| B1 | 1 | Auto mute of FM AF output active |
| | 0 | inactive |

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

| BIT | VALUE | DESCRIPTION |
|-----|-------|---|
| B0 | 1 | Video mode (sound trap) sound trap bypass |
| | 0 | sound trap active |

Notes

- For positive AM TV choose 6.5 MHz for the second SIF.
- For FM radio, select $f_{VIF} = 45.75$ MHz for NTSC applications; otherwise use an arbitrary video IF (see Table 17).

9.2.3 DATA BYTE FOR ADJUST MODE

Table 12 Bit description of SAD register for adjust mode (SAD = 01)

| BIT | VALUE | DESCRIPTION |
|----------|-------|--|
| C7 | 1 | Audio gain -6 dB |
| | 0 | 0 dB |

Notes

- Pin SIOMAD can be used for the selection of the different NTSC standards without I²C-bus. With a resistor on pin SIOMAD, $f_{VIF} = 58.75$ MHz; without a resistor on pin SIOMAD, $f_{VIF} = 45.75$ MHz (NTSC-M).
- Attention: video sound traps are locked on the FM VCO. The second VIF should be selected in accordance with the selected video standard.

Notes

- Values of video and sound parameters can be decreased at V_P = 4.5 V.
- Level headroom for input level jumps during gain control setting.
- This parameter is not tested during the production and is only given as application information for designing the receiver circuit.
- Loop bandwidth BL = 70 kHz (damping factor d = 1.9; calculated with sync level within gain control range). Calculation of the VIF-PLL filter can be done by use of the following formula:

$$BL_{-3dB} = \frac{1}{2\pi} K_O K_D R, \text{ valid for } d \geq 1.2$$

$$d = \frac{1}{2} R \sqrt{K_O K_D C},$$

where:

K_O is the VCO steepness $\left(\frac{\text{rad}}{\text{V}}\right)$ or $\left(2\pi\frac{\text{Hz}}{\text{V}}\right)$; K_D is the phase detector steepness $\left(\frac{\mu\text{A}}{\text{rad}}\right)$;

R is the loop resistor; C is the loop capacitor; BL_{-3dB} is the loop bandwidth for –3 dB; d is the damping factor.

- V_{i(VIF)} = 10 mV (RMS); Δf = 1 MHz (VCO frequency offset related to picture carrier frequency); white picture video modulation.
- Condition: luminance range (5 steps) from 0 % to 100 %.
- S/N is the ratio of black-to-white amplitude to the black level noise voltage (RMS value on pin CVBS). B = 5 MHz (B/G, I and D/K standard). Noise analyzer setting: 200 kHz high-pass and SC-trap switched on.
- The intermodulation figures are defined for:

$$\text{a) } f = 1.1 \text{ MHz (referenced to black and white signal) as } \alpha_{IM} = 20 \log\left(\frac{V_0 \text{ at } 4.4 \text{ MHz}}{V_0 \text{ at } 1.1 \text{ MHz}}\right) + 3.6 \text{ dB}$$

$$\text{b) } f = 3.3 \text{ MHz (referenced to colour carrier) as } \alpha_{IM} = 20 \log\left(\frac{V_0 \text{ at } 4.4 \text{ MHz}}{V_0 \text{ at } 3.3 \text{ MHz}}\right)$$

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

9. Measurements taken with SAW filter M1963M (sound shelf: 20 dB); loop bandwidth BL = 70 kHz.
 - a) Modulation Vestigial Side-Band (VSB); sound carrier off; $f_{\text{video}} > 0.5$ MHz.
 - b) Sound carrier on; $f_{\text{video}} = 10$ kHz to 10 MHz.
10. AC load; $C_L < 20$ pF and $R_L > 1$ k Ω . The sound carrier frequencies (depending on TV standard) are attenuated by the integrated sound carrier traps (see Figs 15 to 20; $|H(s)|$ is the absolute value of transfer function).
11. The sound carrier trap can be bypassed by switching the I²C-bus. In this way the full composite video spectrum appears at pin CVBS. The amplitude is 1.1 V (p-p).
12. If selected by the I²C-bus, the VIF-AGC voltage can be monitored at pin OP2, and pin OP1 can be used as input. In this case, both pins cannot be used for the normal port function.
13. The response time is valid for a VIF input level range from 200 μ V to 70 mV.
14. To match the AFC output signal to different tuning systems a current source output is provided. The test circuit is given in Fig.11. The AFC steepness can be changed by resistors R1 and R2.
15. The tolerance of the reference frequency determines the accuracy of the VIF-AFC, FM demodulator centre frequency and maximum FM deviation.
16. The intercarrier output signal at pin SIOMAD can be calculated by the following formula taking into account the internal video signal with 1.1 V (p-p) as a reference:

$$V_{o(\text{intc})(\text{rms})} = 1.1 \times \frac{1}{2\sqrt{2}} \times 10^r \text{ V}$$

$$\text{and } r = \frac{1}{20} \times \left(\frac{V_{i(\text{SC})}}{V_{i(\text{PC})}} (\text{dB}) + 6 \text{ dB} \pm 3 \text{ dB} \right)$$

where:

$\frac{1}{2\sqrt{2}}$ is the correction term for RMS value, $\frac{V_{i(\text{SC})}}{V_{i(\text{PC})}} (\text{dB})$ is the sound-to-picture carrier ratio at pins VIF1 and VIF2 in dB, 6 dB is the correction term of internal circuitry and ± 3 dB is the tolerance of video output and intercarrier output $V_{o(\text{intc})(\text{rms})}$.

17. For normal operation (with the I²C-bus) no DC load at pin SIOMAD is allowed. The second module address (MAD2) will be activated by the application of a 2.2 k Ω resistor between pin SIOMAD and ground. If this MAD2 is activated, also the power-on set-up state activates a VIF frequency of 58.75 MHz.
18. SIF input level is 10 mV (RMS); VIF input level is 10 mV (RMS) unmodulated.
19. Measured with an FM deviation of 25 kHz and the typical AF output voltage of 500 mV (RMS). The AF output signal can be attenuated by 6 dB to 250 mV (RMS) via the I²C-bus. For handling a frequency deviation of more than 55 kHz, the AF output signal has to be reduced in order to avoid clipping (THD < 1.5 %).
20. The lower limit of the audio bandwidth depends on the value of the capacitor at pin AFD. A value of $C_{\text{AF}} = 470$ nF leads to $f_{\text{AF}(-3\text{dB})} \approx 20$ Hz and $C_{\text{AF}} = 220$ nF leads to $f_{\text{AF}(-3\text{dB})} \approx 40$ Hz.
21. For all S/N measurements the VIF modulator in use has to meet the following specifications:
 - a) Incidental phase modulation for black-to-white jump less than 0.5 degrees.
 - b) QSS AF performance, measured with the television demodulator AMF2 (audio output, weighted S/N ratio) better than 60 dB (at deviation 27 kHz) for 6 kHz sine wave black-to-white video modulation.
 - c) Picture-to-sound carrier ratio $\text{PC}/\text{SC}_1 = 13$ dB (transmitter).

I²C-bus controlled multistandard alignment-free IF-PLL demodulator with FM radio

TDA9887

22. Calculation of the loop filter parameters can be done approximately using the following formulae:

$$f_o = \frac{1}{2\pi\sqrt{\frac{K_O K_D}{C_P}}}$$

$$\vartheta = \frac{1}{2R\sqrt{K_O K_D C_P}}$$

$$BL_{-3dB} = f_o(1.55 - \vartheta^2)$$

The formulae are only valid under the following conditions:

$\vartheta \leq 1$ and $C_S > 5C_P$

where:

K_O is the VCO steepness $\left(\frac{\text{rad}}{\text{V}}\right)$ or $\left(2\pi\frac{\text{Hz}}{\text{V}}\right)$;

K_D is the phase detector steepness $\left(\frac{\mu\text{A}}{\text{rad}}\right)$;

R is the loop resistor;

C_S is the series capacitor;

C_P is the parallel capacitor;

f_o is the natural frequency of the PLL;

BL_{-3dB} is the loop bandwidth for -3 dB;

ϑ is the damping factor. For examples, see Table 20.

23. The PC/SC ratio is calculated as the addition of TV transmitter PC/SC₁ ratio and SAW filter PC/SC₁ ratio. This PC/SC ratio is necessary to achieve the S/N_W values as noted. A different PC/SC ratio will change these values.
24. Measurements taken with SAW filter G1984 (Siemens) for vision and sound IF (sound shelf: 14 dB). Picture-to-sound carrier ratio of transmitter PC/SC = 13 dB. Input level on pins VIF1 and VIF2 of $V_{i(\text{SIF})} = 10$ mV (RMS) sync level, 27 kHz FM deviation for sound carrier, $f_{AF} = 400$ Hz. Measurements in accordance with "CCIR 468". De-emphasis is 50 μs .
25. The QSS signal output on pin SIOMAD is analysed by a test demodulator TDA9820. The S/N ratio of this device is more than 60 dB, related to a deviation of ± 27 kHz, in accordance with "CCIR 468".
26. Measurements taken with SAW filter K3953 for vision IF (suppressed sound carrier) and K9453 for sound IF (suppressed picture carrier). Input level $V_{i(\text{SIF})} = 10$ mV (RMS), 27 kHz (54 % FM deviation).
27. Measurements taken with SAW filter K9453 (Siemens) for AM sound IF (suppressed picture carrier).
28. The value of C_x determines the accuracy of the resonance frequency of the crystal. It depends on the type of crystal used.
29. Pin REF is able to operate as a 1-pin crystal oscillator input as well as an external reference signal input, e.g. from the tuning system.
30. The SDA and SCL lines will not be pulled down if V_{CC} is switched off.
31. The AC characteristics are in accordance with the I²C-bus specification for fast mode (maximum clock frequency is 400 kHz). Information about the I²C-bus can be found in the brochure "The I²C-bus and how to use it" (order number 9398 393 40011).
32. Port P1 and port P2 are open-collector outputs.

15 SOLDERING

15.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "Data Handbook IC26; Integrated Circuit Packages" (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

15.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 seconds and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 °C to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 225 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA, HTSSON-T and SSOP-T packages
 - for packages with a thickness ≥ 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 240 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

15.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
 - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 seconds to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

15.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 seconds to 5 seconds between 270 °C and 320 °C.

15.5 Suitability of surface mount IC packages for wave and reflow soldering methods

| PACKAGE ⁽¹⁾ | SOLDERING METHOD | |
|--|-----------------------------------|-----------------------|
| | WAVE | REFLOW ⁽²⁾ |
| BGA, HTSSON..T ⁽³⁾ , LBGA, LFBGA, SQFP, SSOP..T ⁽³⁾ , TFBGA, USON, VFBGA | not suitable | suitable |
| DHVQFN, HBCC, HBGA, HLQFP, HSO, HSOP, HSQFP, HSSON, HTQFP, HTSSOP, HVQFN, HVSON, SMS | not suitable ⁽⁴⁾ | suitable |
| PLCC ⁽⁵⁾ , SO, SOJ | suitable | suitable |
| LQFP, QFP, TQFP | not recommended ⁽⁵⁾⁽⁶⁾ | suitable |
| SSOP, TSSOP, VSO, VSSOP | not recommended ⁽⁷⁾ | suitable |
| CWQCCN..L ⁽⁸⁾ , PMFP ⁽⁹⁾ , WQCCN..L ⁽⁸⁾ | not suitable | not suitable |

Notes

- For more detailed information on the BGA packages refer to the “(LF)BGA Application Note” (AN01026); order a copy from your Philips Semiconductors sales office.
- All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the “Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods”.
- These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding 217 °C ± 10 °C measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
- These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- Wave soldering is suitable for LQFP, TQFP and QFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- Image sensor packages in principle should not be soldered. They are mounted in sockets or delivered pre-mounted on flex foil. However, the image sensor package can be mounted by the client on a flex foil by using a hot bar soldering process. The appropriate soldering profile can be provided on request.
- Hot bar or manual soldering is suitable for PMFP packages.

16 DATA SHEET STATUS

| LEVEL | DATA SHEET STATUS ⁽¹⁾ | PRODUCT STATUS ⁽²⁾⁽³⁾ | DEFINITION |
|-------|----------------------------------|----------------------------------|--|
| I | Objective data | Development | This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice. |
| II | Preliminary data | Qualification | This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product. |
| III | Product data | Production | This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). |

Notes

1. Please consult the most recently issued data sheet before initiating or completing a design.
2. The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.
3. For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

17 DEFINITIONS

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

18 DISCLAIMERS

Life support applications — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.

TDA9887**19 PURCHASE OF PHILIPS I²C COMPONENTS**

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
